

Chalifoux Architectural Woodworking uses a Soft Closing Drawer System

The full extension runners used in the Chalifoux Architectural Woodworking drawer making process provide a supreme record of quality and reliability. Drawers made with a soft closing system mean that you will hardly hear them close. They will create a relaxed mood and a more efficient working environment. The drawer closing system is completely invisible and works equally well with face frame and frameless cabinets.

Chalifoux uses this system to assure that all drawers will close gently and softly for years. The “silent system” full runner is an advanced technology that is a particularly good choice for high quality furniture – from cutlery drawers loaded with utensils in the kitchen to entertainment center drawers loaded with sensitive electronics. Tracking is perfect because weight is evenly distributed for both vertical and lateral stability. The chrome-hardened steel balls used never lose their perfectly round shape even when moving under pressure.

Chalifoux Architectural Woodworking chooses this drawer closing system for specific design projects because the hardware is built for a lifetime of use. This closing system was masterminded over 20 years ago by one of Germany’s largest manufacturers of quality furniture fittings and has been continually improved over time.

Not only is the system built for a lifetime of use, but also it is also self-cleaning. Dirt in the track is no longer a problem because it is simply swept aside by the steel balls as they glide along the track. Even after many years of service, the incredibly smooth sliding action of the drawers will not be impaired by dirt particles caught in the tracks.

You will love the difference this hardware feature will bring to your custom designed cabinetry, whether in the kitchen, bedroom, den, or office – or any room in your home.
